ACKNOWLEDGEMENTS

The National Association of County and City Health Officials would like to thank all of those who contributed content during the development of this guide. This guide was supported by funds made available from the Centers for Disease Control & Prevention, Office of State, Tribal, Local, and Territorial Support, under award number 5 NU38OT000172-05 Provision of Capacity Building Assistance to Local Health Departments (APT). The contents of this resource are those of the authors and do not necessarily represent the official position of or endorsement by the Centers for Disease Control and Prevention.

A special thank you to the following local public health leaders who contributed content to the creation of this guide:

**Cobb-Douglas Public Health**
Gurleen Roberts, Director of Quality Management

**Humboldt County Health Department**
Georgianna Wood, Performance Improvement Manager

**Harris County Public Health**
Staci Lofton, Health Equity Coordinator

**Lake County Health Department & Community Health Center**
Christina Hayes, Continuous Quality Improvement Analyst
Mark Pfister, Executive Director

**Houston Health Department**
Ololade Coker, Epidemiologist Specialist
Robert Hines, Accreditation Coordinator & Performance Improvement Manager
Introduction
Measuring successes in achieving mission and vision, mobilizing resources, and overall contribution to community health is key to any high performing health department. The challenge with this in public health is that health departments and their community partners have very ambitious goals to improve population health and achieving social change. It is not the charge of the health department to single-handedly achieve health equity, eliminate disease, or address the social determinants of health, but rather to mobilize the community and assess and improve the organization’s individual contribution to achieving these goals by forging progress in meeting community needs through its own programs and services.

Performance management is the mechanism by which any organization can understand its own contributions to moving the needle on these outcomes by carefully aligning operations with organizational and community level strategy, defining its own performance goals and objectives, identifying meaningful performance measures which elucidate performance milestones and gaps, and acting on improvement opportunities to meet its goals. Formally defined, performance management is the practice of actively using performance data to improve the public’s health through the strategic use of performance standards and measures, progress reports, and ongoing quality improvement.

Health departments are experienced in monitoring population health indicators such as disease incidence, behavioral risk factors, or morbidity rates at the community level. Due to grant or other reporting requirements health departments are also accustomed to measuring outputs like the “number of clients served.” Although both health outcome and so called “widget” metrics are important, in isolation, they do little to inform practices that have the most impact on a health department’s mission and vision for the community. For example, knowing the infant mortality rate of a county and the number of mothers seen at a WIC clinic provide limited information on the health department’s impact on infant mortality. However, through an aligned measurement strategy, it is possible to connect the output to outcomes. With the variety of factors that impact infant mortality, measuring performance may seem daunting, however, this guide offers a conceptual approach with pragmatic strategies that may be used to isolate an organization’s contributions and quantify success in the realm of public health.

What is Performance Management?
For even the most experienced professionals, performance management may seem steeped with jargon. PM related terms are often used interchangeably, differently, and sometimes incorrectly in different organizations. It does not matter which definitions a health department or community chooses to use, however, the importance of clearly stating these definitions across internal and external stakeholders cannot be overstated. Communicating in clear terms clarifies expectations for success and reduces risk of misunderstanding goals or misinterpreting data. For clarity, this guide will define terms as they are introduced throughout the guide and include a comprehensive list of definitions in the Glossary. Described below are commonly misunderstood terms and key principles that underline successful performance management. Please note that definitions offered in this guide are intended to communicate key concepts and establish a common language, however, your community should choose the terms and definitions that resonate most with staff and stakeholders.

Performance Management vs. Performance Measurement
Performance management and performance measurement sound similar but understanding the distinction is key. Performance measurement is the use of quantitative metrics and indicators to collect data and track progress against strategy, goals, and objectives. Most organizations are engaged in either formal or informal performance measurement efforts. For example, health departments likely collect data and report on defined performance measures to meet grant
requirements. Performance measurement is valuable in understanding performance and generating reports, but it stops short of driving improvements. Performance management, however, is the practice of actively using performance data to improve the public’s health through the strategic use of performance standards and measures, progress reports, and ongoing quality improvement. Managing strategy involves review of performance data and identifying actions to continuously improve results. In other words, performance measurement tracks progress against strategy while performance management is how an agency manages achievement of that strategy.

The Performance Improvement Umbrella: Aligning Plans

Performance management is essential to understand how well an agency is meeting its goals, but in isolation it is not enough to evolve and continuously meet changing needs of the community. Performance management should work in concert with other performance improvement (PI) initiatives to ensure data driven planning, improvement, and decision-making.

Performance improvement is the positive change in public health capacity, processes, or outcomes using clear and aligned planning, monitoring, and improvement activities.3 Figure 1 below provides a visual of a PI framework illustrating the interplay between assessment, planning, and improvement efforts with performance management underpinning all three. Many organizations are involved in one or more PI activities listed in Figure 1 but a common challenge is aligning all of these efforts to achieve results.

FIGURE 1: The Performance Improvement Framework
Performance management is the thread that weaves together multiple layers of performance assessment, planning, and improvement efforts. Has your health department ever developed a community health improvement plan (CHIP) or strategic plan that was not truly operationalized? Do CHIP or strategy plan implementation seem like extra work? Does your workforce truly understand their role in achieving the agency mission or strategy? Have you implemented multiple QI efforts with marginal impact on outcomes? If so, one or more aspects of your overall performance improvement framework are likely disjointed. Table 1 below summarizes how performance management links to each component of a health department’s overall PI framework.

Table 1: Linking Performance Improvement with Performance Management

<table>
<thead>
<tr>
<th>PI Activity</th>
<th>Link to Performance Management System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community Health Assessment &amp; Improvement Plan</td>
<td>The community health assessment (CHA) outlines the community-wide health status on various population health indicators which informs the priorities and strategies in the community health improvement plan (CHIP) - a community-wide strategic plan directed at improving health outcomes and implemented in collaboration with multi-sectoral partners. PM allows each community partner to monitor and track their individual contribution to the CHIP.</td>
</tr>
<tr>
<td>Agency Strategic Plan</td>
<td>To ensure the CHIP is implemented, each community partner should seriously consider how their work directly or indirectly relates to the CHIP priorities when developing or updating the agency strategic plan. The strategic plan should incorporate the agency’s role in implementing the CHIP and identify a strategy for achieving the agency mission and vision, given current environmental factors impacting agency performance. The strategic plan is fundamental to PM; the agency strategic plan includes strategic priorities and goals that reflect where the agency wants to go while PM outlines key performance indicators and measures that tell you whether you are getting there.</td>
</tr>
<tr>
<td>Operational Plans</td>
<td>Each division, program, or work unit across the agency should engage in its own operational or action planning efforts to: 1). Understand how their work can contribute to agency strategy; and 2): Develop operational or action plans outlining programmatic objectives and activities that align either directly or indirectly to the strategic plan. If the strategic plan is the nucleus of PM, the operational plans are the nerve endings.</td>
</tr>
<tr>
<td>QI Plan</td>
<td>Performance management reveals opportunities for improvement which should be prioritized for QI projects. Performance data is the backbone of QI; resources should be devoted to QI projects where the greatest gaps between agency goals and actual performance exist. Performance data are also critical to implementation of QI projects as reviewing data at baseline and after applying an intervention can reveal whether a change leads to improvement.</td>
</tr>
<tr>
<td>Employee Performance Plans</td>
<td>Every employee in the health department plays a role in achieving the agency mission. Performance data should be used to provide ongoing and constructive feedback so that employees may improve their own work. Improving individual work could be formal, such as participating in a QI project or pursuing training opportunities. It can also be informal, such as using QI or project management tools to make individual work more efficient or effective.</td>
</tr>
<tr>
<td>Workforce Development Plan</td>
<td>As mentioned, the workforce is the backbone to achieving any organization’s mission. Workforce assessments and satisfaction surveys can reveal gaps in workforce competencies and sources of low morale or other capacity issues, respectively. The agency workforce development plan should also include performance objectives and measures to monitor the capacity of the workforce to deliver agency strategy.</td>
</tr>

</table>
Culture of Quality
Health departments have embraced the concept of achieving a culture of quality wherein concepts of quality improvement (QI) are ingrained in the shared attitudes, values, goals, and practices of all individuals, teams, and divisions. In NACCHO’s Roadmap to a Culture of Quality, performance management is presented within one of the six foundational elements of a culture of quality. Performance management elucidates gaps in programs and services, allows for a deep understanding of customer needs and how those needs are being met, and provides data to inform whether change results in improvement. Visit NACCHO’s QI Roadmap to learn how performance management relates to QI.

Develop a Community and Agency Level Strategy
Have you ever put immense effort and resources into developing a community health improvement plan (CHIP) or strategic plan only to have it sit on a shelf? Often, when community or agency strategic plans are not executed, it is because no formal mechanism for performance management exists. A PM assessment may reveal some PM practices in place, yet strategic goals are still not realized. Common pitfalls of these fragmented practices include a lack of alignment between strategic priorities and operational or programmatic objectives and measures, excessive metrics unrelated to strategy, and an emphasis on counting activities versus managing performance in service of strategy.

Community Health Improvement Plan
The CHIP is a community-owned strategic plan to address public health problems identified from a community health assessment. It outlines strategic issues which negatively impact health and have no readily identifiable solutions. Strategic issues are typically broad and focus on root causes such as policy or the built environment. In collaboration with the community, the health department defines an implementation plan delegating strategic issues across partners. One agency should not assume responsibility for implementation of the entire CHIP as it would not have the resources, expertise, or scope of authority. Each community partner should consider how to integrate CHIP priorities into their respective strategic plans to sustain CHIP implementation. For more information on developing a CHIP, visit the Mobilizing for Action through Planning and Partnerships (MAPP) webpage.

Agency Strategic Plan
The strategic plan defines a strategy for fulfilling agency mission and vision using broad strategic priority areas based on an environmental scan of factors impacting the agency’s work. The strategic priorities should identify the health department’s role in implementing the CHIP along with addressing key support functions to improve internal performance, such as communications, branding, or information technology. For more information on strategic planning, visit NACCHO’s Developing a Local Health Department Strategic Plan How-To Guide.

Figure 3 provides a snapshot of how multiple sectors can align CHIP, strategic plan, and operational plans to create a built environment that promotes health equity; performance management provides a framework for aligning each of
these levels. This is a good illustration of how program and agency metrics from an internal performance management system should align with population level outcomes and broader community health improvement efforts. The CHIP and agency strategic plan are like guiding lights embodying the long-range vision for the community, and health department’s role in achieving that vision, respectively. This guide will focus attention on aligning plans and cascading strategic priorities down to every program or work unit.

FIGURE 3: Aligning CHIP, Strategic Plan, and Program Goals and Measures

- Community Strategic Issue: How can we create a built environment that promotes health equity?
  - Population Indicators:
    - Proportion of smoke-free homes
    - % of children <6yrs diagnosed with elevated blood lead level
    - % of population without access to affordable housing
    - % of population that is food insecure

- Health Department Strategic Priority: Promote health through physical environment
  - Key Performance Indicator 1: % of population in multi-unit housing living in smoke-free buildings
  - Key Performance Indicator 2: % of homes with lead-based paint

- Housing Authority Strategic Priority: Community support for affordable housing
  - Key Performance Indicator: % of low income families with access to affordable housing

- Public School System Strategic Priority: Food Security
  - Key Performance Indicator: % of K-12 students with access to healthy food options in school

- Tobacco Control Program Strategic Goal: Increase access to smoke-free, multi-family housing options
  - Performance Measure: % of multi-unit housing owners presented with smoke-free policy benefits

- Lead Poison Prevention Program Strategic Goal: Reduce # of homes in low-income communities with lead-based paint
  - Performance Measure: % of homes in low-income communities tested for lead

- Housing Voucher Program Strategic Goal: Link low-income families to housing vouchers.
  - Performance Measure: # of private landlords accepting vouchers.

- Community Development Program Strategic Goal: Increase affordable housing stock
  - Performance Measure: $ secured for new housing development projects

- Farm-to-School Program Strategic Goal: Increase student access to health foods
  - Performance Measure: # of schools participating in Farm-to-School Program
Laying the Groundwork for Performance Management

Once leadership decides to formalize PM in the agency, the first steps involve recruiting and training champions, assessing the current performance management efforts, and developing a plan.

Establish a Performance Management Committee

A PM committee should drive performance management in the agency. Forming a cross-sectional committee helps to spread PM throughout an agency, while providing support for performance management throughout the agency. It is ideal if these members have some level of authority, such as division heads, so that each work unit is held accountable to PM. Executive leadership, key frontline staff or early adopters, and data experts should also be engaged, as appropriate.

Train Staff in Performance Management

One of the first orders of business should be to assess performance management knowledge, skills, and abilities (KSAs) and address gaps through workforce development. Because leadership and the PM committee will need to drive these efforts, they should be among the first trained. This will allow for them to develop a systematic plan for moving forward. Eventually, every level of the workforce should be engaged in, and therefore, trained in performance management.

Conduct a Performance Management Self-Assessment

Formally assessing your agency culture of quality, including current performance management efforts, helps to identify not only the gaps but what current practices can be leveraged. For example, it would be important to identify where across the organization performance measures are already being used. A formal assessment tool can help to provide structure to this process. Commonly used assessment tools in public health include NACCHO’s Organizational Culture of Quality Self-Assessment Tool (SAT) (designed to be a comprehensive assessment of both a culture of quality improvement and performance management), the Baldrige Criteria, and the Turning Point Performance Management Self-Assessment. Once an assessment is complete, use that data to identify priority actions for inclusion in your performance management and/or QI plans.

Develop a Performance Management Plan

The performance management assessment data should inform a PM plan which outlines key structures and processes for integrating performance management across the agency. A PM plan should address the following areas:

- **Staff Engagement** - How are leadership and staff engaged in PM, including respective roles and responsibilities across the agency?
- **PM Committee** - Who is on the PM Committee and how is it structured and governed?
- **PM Processes** - What are the processes for developing performance goals, measures, and standards?
- **Data Collection and Analysis** – What data systems are being used for managing data? What processes are in place for data collection and reporting?
- **Improvement** - How does performance management inform quality improvement efforts?

Examples of performance management plans can be found on NACCHO’s Performance Management page.

About this Guide

Performance management may seem abstract but having a systematic approach can help with department-wide engagement and consistency. Many approaches and frameworks to performance management exist, and this guide references several commonly-used frameworks. Health departments, each with their own unique culture, structure, assets and challenges, should select the approach that best meets its needs. The remainder of this guide offers one pragmatic approach to creating an integrated PM system. The seven steps offered here are supplemented by templates, worksheets, and stories from the field.
Formal Agency-Wide Performance Management: Seven Steps for Success

A common pitfall is to begin writing performance measures before getting consensus on what a program or agency is trying to achieve. The value of PM is not to simply to measure something but to measure the right things. Once agency strategy is defined, the following process should be facilitated with every division, work unit, or program area to align day-to-day operations with strategy. Figure 4 provides a snapshot of the seven steps of performance management presented in this guide.

</tbody>
</table>
Step 1: Align Program Purpose with Agency Strategy

**Goal:** Align program or work unit purpose with strategy

By the end of this step, each program or work unit will:

- Define program purpose
- Identify the program’s customer needs
- Articulate how the program aligns with agency strategy

**Define Program/Work Unit Purpose**

As the field of public health is shifting some of its resources from traditional public health interventions to promoting health equity and addressing the social determinants of health, health departments should re-examine their mission and strategy to meet the changing needs of their communities. In concert with agency level planning, program staff should regularly consider their role in improving the public’s health and be ready to change course, as needed.

To effectively manage performance, staff from every program should step back and identify the fundamental purpose of the program. If one does not exist, develop a purpose statement which answers the following three questions:

- Why does the program exist?
- What does the program do?
- For whom does it do it?

The statement is the overarching purpose of the program and performance goals should subsequently flow from that purpose. At this level, you want to remain broad, not defining your program by how you do the work, but by the general work you do and the results you seek to achieve. Note that the tobacco control example included here states its purpose through broad strategies like policy change versus specific activities such as a tobacco quit line.

Use the facilitation questions presented above and the purpose statement template to the right to achieve group consensus on a purpose statement. **Worksheet 1** in the Appendix can be used to facilitate this process with each program or work unit.

**Identify and Understand Customers**

Effective performance management elucidates whether programs are designed and delivered to meet customer needs and expectations. A common mistake is to assess satisfaction in the absence of understanding customer needs, programs in a perpetual state of reactive improvement efforts. The key is to close the gap between customer needs and actual experience by first identifying who the customers are and understanding their respective needs.
In public health, the customer is essentially the broad community, however, there are many customer segments or sub-populations within a community, each with a unique set of needs. For example, racial or ethnic groups who are disproportionately affected by health inequities warrant targeted efforts to address root causes of health inequities; those with access to healthcare have different needs than the uninsured; specific neighborhoods may be exposed to greater environmental health hazards due to geographic location. Charged with the responsibility to improve population health, health departments must remain attuned to the diverse needs across the community.

The term “customer” refers to both internal and external parties who directly or indirectly interact with the program or work unit. External customers are anyone outside of the agency, such as those mentioned above. Internal customers are those within the agency who depend on another internal work unit. For example, new staff are a customer subgroup to the Human Resources work unit. Use the facilitation questions in the box to the right to assist with brainstorming all customers of your program or work unit.

Once all customers have been identified, programs should identify each of their specific needs. The following data sources may help to identify customer groups and their needs:

- Community health assessment results related to program area
- Stakeholder analyses (e.g. part of a strategic planning process)
- Customer needs assessments
- Customer satisfaction data
- Employee satisfaction surveys
- Evaluation or quality improvement results
- Past performance data
- Employees working directly with customer groups

Use Worksheet 2 in the Appendix to help identify the specific needs of each customer group.

**Articulate Link to Agency Strategy**

Defining a program’s purpose provides a good foundation to link the program’s work to overall agency strategy. This step is important for two reasons: 1) a CHIP or agency strategy plan is difficult to operationalize unless programs and work units make a deliberate connection to the defined strategy; and 2) understanding how day-to-day work fits into a larger purpose builds employee commitment to their work. This connection to strategy may be more direct for some programs than others depending on the strategic priorities selected. For example, a strategic priority focusing on infant mortality clearly links to a maternal and child health program. However, other programs may also identify linkages such as a lead abatement program which impacts the health of babies and children. Revisit Worksheet 1 to articulate the link between the program purpose and agency strategy and identify any strategic priority area or goal from the strategic plan that links to the program or work unit.
Step 2: Identify Outcomes, Goals, and Objectives

**Goal:** Articulate what the program seeks to achieve

By the end of this step, each program or work unit will:

- Identify outcomes over which the program has control
- Define overarching goals that link to agency strategy
- Define concrete objectives for achieving goals

In the previous step, each program articulated the overall purpose of the program. In this step, the program should identify the outcomes or results it has control over and how those outcomes contribute to the broad program purpose. First, let’s define the following key terms.5

- **Impact:** The organizational, community, or system level changes that result, in part, from program activities. Examples may include improved living conditions, improve community indicators, and/or policy change.

- **Outcome:** Specific changes in knowledge, attitudes, behaviors, skills, status, or level of functioning expected to result from specific program activities. Outcomes are expressed as different levels of results a program seeks to achieve.

The distinction between impact and outcomes is critical, as one organization or program alone should not be held accountable for creating system level change but rather, should be able to clearly demonstrate how its own achievements may contribute to overall impact.

**Identify a Sequence of Outcomes**

A logic model is a tool to map out anticipated program outcomes using a visual depiction of the sequential relationship among your program’s resources, activities, outputs, and outcomes. Outcomes are essentially hypotheses about the results program activities will achieve. **Figures 5 and 6** on the following page define and illustrate a general sequence of short, intermediate, and long-term outcomes using logic models. Every program or work unit should complete or update a logic model to inform their performance goals, objectives, and measures. In this step, you will first brainstorm outcomes on the right side of the logic model prior to identifying activities and outputs on the left. This allows employees to focus on what the program should ideally seek to achieve without being clouded by existing activities.

Reference the definitions of short, intermediate, and long-term outcomes in **Figure 5** on the following page and use **Worksheet 3** to complete the “outcomes” side of the logic model. You will revisit and complete the left side of the logic model in **Step 3: Linking Activities to Outcomes, Goals, and Objectives.**
FIGURE 5: Mapping Outcomes Using a Logic Model

**Short-term Outcome**
- Results that are directly tied to the program activities.
- Usually reflects a change in knowledge or attitudes of an individual or group.
- Programs have the most control over these outcomes.
- Typically occur immediately after delivery of program or service.

**Intermediate Outcome**
- Results that typically reflect actions or behavior changes that are based on changes in knowledge or attitudes resulting from the program.
- Likely to lead to long-term outcomes.
- Programs have less control over these outcomes.
- Typically occur within several months after program delivery.

**Long-term Outcome**
- Reflect change in status or conditions due to changes in knowledge, attitudes, and behaviors resulting from the program.
- Seen among customers of the program.
- Factors outside of the control of the program impact these outcomes.
- Typically occurs several years after program delivery.

**Impact**
- Organizational, community, or system level changes resulting from coordinated efforts across programs, organizations, and sectors.
- Include improving living conditions, health status, or policy change at the societal level.
- Typically occur after 6+ years.

FIGURE 6: Enhance Access to Public and Private Smoke-Free Spaces: Outcomes Sequence Example

**Short-term Outcome**
- Increased public and policy-maker knowledge of tobacco-related health disparities and dangers of second-hand smoke.

**Intermediate Outcome**
- Increased public and policy-maker support for smoke-free policies.
- Increase public compliance with existing tobacco-control policies.

**Long-term Outcome**
- Increased adoption of smoke-free policies in public and private spaces.
- Decreased exposure to second-hand smoke.

**Impact**
- Decreased tobacco-related disease and illness.
- County or state level policy change.
Develop Goals and Objectives

From the agency strategic plan and the short, intermediate, and long-term outcomes, each program should derive key goals and objectives for which it will be responsible. As stated previously, it is critical to align program goals and objectives with strategic goals as much possible.

Goals and objectives are frequently used interchangeably; this guide offers the following definitions:

- **Goal**: Long-range outcomes statements that broadly define the direction of the program.

- **Objective**: Short to intermediate outcome statements that are concrete and tied to the achievement of goals. Objectives are clear, measurable, specific, time-bound, and communicate how a goal will be achieved.

Table 2 summarizes the key distinctions between goals and objectives. To identify goals, look at the program’s longer-term outcomes and revisit the strategic plan to identify strategic priorities to which the program contributes. Prioritize the most strategic goals and be careful not to set too many goals at any given time.

To identify key program goals, ask:

- Where are the program’s performance gaps?
- Which customer needs is the program not meeting?
- How can customer satisfaction be improved?
- Is the program efficient?
- How can the program contribute to achievement of agency strategy?

Once goals are in place, write objectives describing the short to intermediate-term milestones toward goal achievement. Most goals will have multiple objectives associated with them. A common mistake in this step is to write activities instead of objectives. A good test is to brainstorm multiple activities for inclusion under the objective. If this is difficult, it is likely an activity. For example, “train 40% of low-income multi-family housing landlords in dangers of second-hand smoke” is an objective while developing training content, sending training invitations, and delivering trainings would be activities under the objective.

Use the following SMART criteria to write strong objectives:

- **Specific**: Does the objective specify what will be accomplished and for whom? Eliminate ambiguity by being as specific as possible.
- **Measurable**: How will success be measured? How much change is expected? Express the objective in quantifiable terms.
- **Achievable**: Is the objective feasible to achieve? Are there sufficient resources? Write an objective that is challenging but within reach.
- **Relevant**: Does the objective contribute to the overarching goal or strategy?
- **Timebound**: Within what timeframe will the objective be achieved?

Use Worksheet 4 to develop goals and associated SMART objectives for each program or work unit.
Step 3: Link Activities to Outcomes, Goals, and Objectives

**Goal:** Link activities to desired results

By the end of this step, each program or work unit will:

- Complete a logic model with inputs, activities, and outputs
- Identify the activities in service of achieving outcomes

Program and work units are already delivering activities that support outcomes, goals, and objectives. The logic model referenced in the previous step may be used to illustrate the connection between these activities and the outcomes, goals, objectives. The components of the left side of the logic model are defined below:

- **Inputs:** the resources and assets used to support program activities (e.g. staff, facilities, equipment, materials, relationships) and barriers that must be addressed (e.g. history of conflict, norms inconsistent with program goals).

- **Activities:** the processes, techniques, tools, events, and actions of the planned program. These may include products – promotional materials and educational curricula; services – education and training, counseling, or health screening; and infrastructure – structure, relationships, and capacity used to bring about the desired results.

- **Outputs:** the direct results of program activities, usually described in terms of the size and/or scope of the services and products delivered or produced by the program. Outputs are important to measure as they indicate whether a program was delivered to the intended audiences at the intended “dose.” Examples include number of classes taught, meetings held, materials produced and distributed, or hours of service provided.

Revisit Worksheet 3 and complete the left side of the logic model to align activities with the outcomes, goals and objectives. The goal is to analyze current activities and link them to the intended results. Programs or work units may reference existing workplans or operational plans to complete this step. If there is a long list of activities, it may be helpful to first summarize and then incorporate them into the logic model. One activity will likely link to multiple outcomes. When incorporating activities into the logic model it is best to use evidence-based, best, or promising practices, where possible. Once data is collected, you can revisit the logic model to determine whether the “logic” holds true and test whether the activities truly lead to the outcomes identified.

For more examples and detailed guidance on developing logic models, reference the following resources:

- The Kellogg Foundation’s comprehensive guide to logic models
- Metrics for Healthy Communities: Building a Culture of Health through Better Measurement
Step 4: Write Performance Measures

**Goal:** Measure performance to assess progress towards goals and objectives

By the end of this step, each program or work unit will:

- Identify performance indicators for assessing progress against strategic goals and long-term outcomes
- Identify performance measures for assessing how a program contributes to outcomes

Once strategic goals and objectives reflecting the program’s short to long-term intended outcomes are in place, they should be translated into performance indicators and measures to assess how efficiently and effectively goals and objectives are achieved. The distinction between performance indicators and performance measures is one of the most misunderstood. This guide offers the following definitions for three commonly used terms in performance management:

- **Community Level Indicator** – A quantitative expression that measures something about a population group rather than the individual level. Community indicators tell you something related to overall health in the community for which no single organization should be held accountable. Community indicators such as infant mortality rates, unemployment rates, or cigarette sales are often assessed through the CHA. Community indicators performing poorly are prioritized for the CHIP and will involve multiple partners and sectors. Each of these partners should adopt the same community level indicators, however, each will have their own set of related program level performance measures and indicators. Health department programs should focus their performance measures on their direct customers while also monitoring community indicators over time.

- **Key Performance Indicator (KPI)** – A quantitative expression of success or progress toward a strategic goal. KPIs measure critical aspects of achieving strategy in an organization and quantify results of a program(s). In contrast to a community health indicator, KPIs only measure critical outcomes related to the direct customers of a program. For example, a CHIP goal may be to reduce the community’s teen pregnancy rate. The local health department aligns its strategic plan with the CHIP, adopting “reducing teen pregnancy” as a strategic priority, and starts a program working with high school youth at a few schools. The health department tracks teen pregnancy rates for those specific schools as a KPI while also monitoring community-wide rates of teen pregnancy as a community-level indicator.

- **Performance Measure** – A quantitative expression of how much, how well, and at what level programs, services, and products are provided to customers within a given period. In other words, performance measures directly measure or quantify activities and processes of a program. Examples of performance measures may include cycle times or errors rates.

The difference between a KPI and a performance measure is that KPIs estimate progress toward a strategy and relate to intermediate or long-term outcomes while performance measures directly assess day-to-day activities and processes. In other words, KPIs tell you whether you are succeeding while performance measures tell you how you can improve operations. KPIs can also be referred to as outcome measures. The terminology used is not as important as properly applying the concepts and principles behind the terms. Some agencies may use a different set of terms or definitions; what matters is that terms are clearly defined, and all stakeholders have a common understanding.
Types of Performance Measures

All performance measures or indicators fall into one of two categories, those that focus on results and those that focus on operations. Measuring operations alone will not indicate whether outcomes are achieved and measuring outcomes alone will not indicate whether the program has led to the desired outcome. Therefore, both process and outcome measures are important to effectively measure performance. Figure 7 below provides examples of the following measures using the Tobacco Control example illustrated in Figure 6.

- **Input measure** – measures the resources devoted to delivering a program or service (e.g. staff time, dollars spent). Input measures answer the question, “How much did it cost to deliver this program?” or “What resources are needed to implement this program?”
- **Process measure** – measures specific aspects of program activities or steps in processes that lead – either positively or negatively – to an outcome. Process measures answer the questions, “Are we implementing our program as planned?” or “Are we doing the right things to improve outcomes?”
- **Output measure** – quantify the immediate results of program delivery such as the amount of services delivered, the reach of services, or how much was accomplished. They answer the questions, “How many services did we deliver?” or “How many people did we reach?”
- **Outcome measure** – quantitative measures of specific results programs are intended to achieve. These commonly relate to quality, customer satisfaction, cost effectiveness, or health outcomes. These answer the question, “Are we impacting our customers?” or “Are we achieving our goals?” These are typically the key performance indicators.

**FIGURE 7:** Access to Public and Private Smoke-Free Spaces: Performance Measures

Monitoring a mix of each type of measure provides information to help explain why a program is not meeting its outcomes. Operational performance measures provide data on what aspect of the program’s activities are not working and help identify QI projects, which we will discuss in Step 7. As illustrated in Figure 7, the logic model can also be useful to identify meaningful performance measures and indicators. The key is to ensure that there is a clear causal link between operational measures and outcome measures.
Balanced Performance Measures

To develop a good mix of operational and outcome measures it is helpful to use a framework to select a balanced set of metrics that assess performance from different angles or perspectives. For instance, a common mistake is to focus too heavily on finance measures or output measures such as number of clients served without looking at other critical measures like client satisfaction or service quality. The Balanced Scorecard is one of the most widely used performance management frameworks which measures performance across four perspectives: customer, finance, internal process, and workforce. The Results Based Accountability approach guides performance measurement using three questions: “How much did we do?,” “How well did we do it?,” “Is anyone better off?” The Baldrige Excellence Framework assesses performance across seven criteria. Table 3 presents common perspectives to consider when developing performance measures. No single framework or set of perspectives will work for every agency. It is important to consider the unique context of the agency’s performance, capacity, and community needs and adapt these perspectives to get the most comprehensive picture of performance.

Table 3: Performance Measures Perspectives

<table>
<thead>
<tr>
<th>Perspective</th>
<th>Answers the Questions:</th>
<th>Example Metrics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer</td>
<td>- Are our customers satisfied with our services?</td>
<td>- % of clients satisfied with service</td>
</tr>
<tr>
<td></td>
<td>- Are we meeting the needs of the community?</td>
<td>- % of training participants that indicate increase in knowledge as a result of training program</td>
</tr>
<tr>
<td></td>
<td>- Are we adequately engaging the community?</td>
<td>- % of school principles satisfied with programs/services targeted toward schools</td>
</tr>
<tr>
<td>Finance</td>
<td>- How well are we funded?</td>
<td>- % of grant dollars expended on time</td>
</tr>
<tr>
<td></td>
<td>- Do we have enough resources (FTEs, $$,) to meet goals?</td>
<td>- Total dollar value of grants received</td>
</tr>
<tr>
<td></td>
<td>- Do we have the necessary infrastructure, technology, etc. to deliver high quality products?</td>
<td>- % of submitted grant applications funded</td>
</tr>
<tr>
<td>Internal Process</td>
<td>- Are our process for delivering products and services effective and efficient?</td>
<td>- Cost per person that quit smoking (efficiency measure)</td>

<td></td>
</tr>
</tbody>
</table>

Defining Performance Measures

Performance measures are most commonly written as either a number (e.g. raw count, average) or percentage, rates, or proportion. Write your performance measures very clearly to eliminate ambiguity and varied interpretations. Figure 7 describes the components of a performance measure. You can download NACCHO’s Performance Measures and Data Collection Plan Template to create a library of clearly defined performance measures for each of your programs. Transfer goals and objectives developed in the previous step to this template to help align measures.
<table>
<thead>
<tr>
<th>Component</th>
<th>Component Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performance Measure Title</td>
<td>A brief heading capturing the focus of the measure</td>
<td>HPV immunization series completion rate among 11-26 yr. old clients</td>
</tr>
<tr>
<td>Definition</td>
<td>A clear and concise description of the indicator</td>
<td>Percent of Immunization clinic clients between the ages of 11-26 years old who receive complete HPV vaccination dosage in past year. This includes health department and community health center (CHC) run clinics, but not privately-run providers.</td>
</tr>
<tr>
<td>Purpose/Rationale</td>
<td>The reason that the indicator exists; why it is needed and useful</td>
<td>The HPV vaccination may prevent certain strains of cervical cancer in women. The CDC recommends administering the HPV vaccination to children starting at age 11 and up to age 26.</td>
</tr>
<tr>
<td>Numerator</td>
<td>The top number of a common fraction, which indicates the number of parts from the whole that are included in the calculation</td>
<td>The number of clients between the ages of 11-26 years old who received the complete HPV vaccination dosage in the past year, across health department and CHC clinics</td>
</tr>
<tr>
<td>Denominator</td>
<td>The bottom number of a common fraction, which indicates the number of parts in the whole</td>
<td>The total number of individual clients between the ages of 11-26 years old who visited a health department or CHC clinic in the past year</td>
</tr>
<tr>
<td>Calculation</td>
<td>The specific steps in a process to determine the measure’s value</td>
<td>Numerator divided by the denominator; multiplied by 100. The numerator will be calculated by obtaining the disaggregated data for health department and CHC run providers. The number of 11-26 yr. old clients that have initiated the vaccination series from each provider will be summed together. The denominator will be calculated by summing together all 11-26-year-old clients across health department and CHC run clinics.</td>
</tr>
<tr>
<td>Data Collection Methods</td>
<td>Data sources and the general approaches used to collect data (e.g. surveys, records, direct observations.)</td>
<td>The data will be collected from the state Immunization Information System (IIS). Data will be disaggregated for health department and CHC run clinics to obtain the numerator. Clinic records will be used to obtain the total number of 11-26 yr old client visits to obtain the denominator. Calculated rates will be manually entered into the health department information system. All clinic managers will be responsible for reporting number of clinic clients to the nursing manager at the health department. The nursing managing will calculate HPV immunization rates and input into the department information system monthly.</td>
</tr>
</tbody>
</table>

*Adapted from UNAIDS. An Introduction to Indicators. Available at: [http://www.unaids.org/sites/default/files/sub_landing/files/8_2-Intro-to-IndicatorsFMEF.pdf](http://www.unaids.org/sites/default/files/sub_landing/files/8_2-Intro-to-IndicatorsFMEF.pdf)
Criteria for Selecting Performance Measures

Translating objectives into performance measures may seem straightforward but it is easy to adopt measures that may misrepresent performance, be infeasible to monitor, or irrelevant to the performance objective. Selecting too many performance measures is another common mistake that can lead to staff frustration and low return on investment. Figure 8 lists criteria for selecting performance measures.11

Where possible, use performance measures and indicators that already exist, as they have already been tested and provide opportunity to benchmark with others in the field.

The following resources may be used for finding existing performance measures:

- **Example Performance Measures from Clear Impact**: This webpage provides examples of measures for different program areas, based on the Results-Based Accountability model for selecting performance measures
- **Big City Health Department Population Indicator and Performance Measures Library**: This resource provides a library of indicators and performance measures, categorized by common public health topic areas.
- **Healthy People 2020 Indicators**: Provides national level objectives, indicators, and benchmarks across a variety of public health related topic areas

---

**FIGURE 8: Criteria for Selecting Performance Measures**

- **Relevance**: Is the measure relevant to the strategic goals and objectives
- **Importance**: Does the measure assess an important aspect of the objective (e.g. delivery process, customer satisfaction)?
- **Clarity**: Does the measure clearly describe what is being measured to users? Is there room for misinterpretation?
- **Feasibility**: Is data collection feasible? Is the data likely to be valid?
- **Uniqueness**: Is the measure duplicative or overlapping with other measures?
- **Manipulability**: Does the measure encourage staff to manipulate data (e.g. tracking # of complaints resolved may discourage preventing complaints in the first place)
- **Program Influence**: Is the influence a program has over an outcome balanced with the need to track key outcomes?
- **Longevity**: Can this be measured and compared over time?

Step 5: Set Performance Standards and Targets

**Goal:** Set performance standards and targets for performance measures

By the end of this step, each program or work unit will:

- Identify sources for common standards and targets
- Set standards and targets for performance

Once the program or work unit has established a set of performance measures, it is time to set performance standards or targets. A performance standard is a management-approved quantified expression of the performance threshold(s), requirement(s), or expectation(s) that work units aim to achieve. Performance standards specify a desired level of performance and provide benchmarks for comparing actual performance to desired performance. Setting performance standards may sometimes seem arbitrary, but there are many different strategies for identifying appropriate performance standards. Use the following guidance to identify common sources for setting standards in public health:

- **Regulations and Mandates:** Health departments are the public health authority in their communities and are commonly subject to meeting certain regulations and mandates. Always consider regulations or standards at the county, state, or federal level when setting performance benchmarks. For example, standards related to drinking water quality, emissions from wastewater treatment plants, or public health workforce credentialing may be used to benchmark performance.

- **Peer Organizations or Jurisdictions:** For some measures, it is valuable to compare performance to organizations with similar missions and goals or jurisdictions with similar demographic characteristics. For example, County Health Rankings & Roadmaps (CHR&R) annually release reports providing comparisons among counties in each state on more than 30 health indicators. CHR&R also offers a peer county comparison feature to find and compare health indicators with counties across the country having similar demographic, social, and economic indicators. Note that this resource provides population level data on health outcomes, factors, and policies and would likely be most informative for setting targets for outcome measures.

- **Past Performance:** It is always valuable to consider past performance data when setting standards and targets. Analyzing performance trends over time reveal whether performance is improving or declining. If performance is particularly low when compared to generally accepted standards (e.g. Healthy People), it may be too ambitious to use that standard. Past performance data allows programs and work units to set targets that are balanced with being stretch targets while also being realistic.

- **National, State, or County Data and Recognized Standards:** Generally recognized standards in the field may also be considered for setting targets. For example, Healthy People 2020 provides a comprehensive set of 10-year national goals with established benchmarks for improving health across 42 topic areas. The state health improvement plan may also provide useful benchmarks to compare performance. In addition, trade associations often have established industry standards. There are several sources of secondary data which can be used to benchmark performance such as the Behavioral Risk Factor Surveillance System, Health Indicators Warehouse, and the National Equity Atlas. Community Commons allows users to drill down and access data at the neighborhood level which can allow for benchmarking against surrounding neighborhoods in a single community.
Step 6: Develop Data Collection and Reporting Protocols

**Goal:** Develop a system for managing and reporting data

By the end of this step, each program or work unit will:

- Define data collection protocols
- Select an information system for managing data
- Define performance reporting protocols for different stakeholders

**Data Collection Protocols**

Carefully identifying data collection protocols is key to getting valid and reliable data. Just as poorly written performance measures can work against you, invalid data will also have little value and may steer your program or organization in the wrong direction. Having clearly defined data collection protocols will help assure that performance data is accurate, timely, and a reliable assessment of the program’s performance. Data experts should continue to be engaged in defining these protocols. A data collection plan should include the following:

- **Collection Methods** – Data sources and the general approaches used to collect data (e.g. surveys, records, direct observation)
- **Data Collection Frequency** – The internals at which data are collected (e.g. quarterly, annually). Note that frequency of data collection may be different than reporting frequency (discussed below).
- **Calculation** – The specific steps in the process to determine the value.
- **Performance Measure Definitions** – As discussed in Step 4, performance measure definitions provide the full context and intent of the measure, including the purpose, numerator, denominator, etc.
- **Roles and Responsibilities** – Identify who will be responsible for collecting and inputting data. Typically, line staff are responsible for collecting output or process measures while data experts may collect and calculate outcome measures.

It is important to revisit Step 4 to finalize performance measures once data collection protocols have been identified. Measures may need to be revised depending on the feasibility of data collection. Finish completing the [Performance Measures and Data Collection Plan Template](#) to incorporate data collection protocols with the performance measures defined in Step 4.
Selecting an Information System

As an organization formalizes performance management, an effective information system with which to collect, analyze, and access data is necessary. The information system may be more or less sophisticated depending on how experienced the organization is with performance management. Prior to investing in a costly information software, careful plan to make sure the software meets the agency’s needs. An information system can range from a simple series of Excel spreadsheets to a commercial software or other platform. Click here to read about Houston Public Health’s process to select and evolve their information system.

When just getting started with performance management, many health departments begin with an Excel spreadsheet or another resource that does not require much training or resource investment. There is great value in establishing processes for writing meaningful goals, objectives, and measures prior to investing in a costly software. You can adapt this Excel-based dashboard template to enter each program’s goals, objectives, measures, standards, and data.

**FIGURE 7: Considerations for Selecting an Information System**

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Questions to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cost</strong></td>
<td>✓ What is the initial cost of developing/acquiring the system? ✓ What is the ongoing cost of maintaining the system?</td>
</tr>
<tr>
<td><strong>Interoperability</strong></td>
<td>✓ How will the system align with – or enhance - existing systems? ✓ Should data be automatically populated or manually entered? ✓ How frequently do data need to be updated?</td>
</tr>
<tr>
<td><strong>Stakeholder Needs</strong></td>
<td>✓ Who are the end users? ✓ Will internal and external stakeholders be using the system? ✓ What are the needs of each stakeholder?</td>
</tr>
<tr>
<td><strong>Data Analysis &amp; Visualization</strong></td>
<td>✓ Can data be manipulated and analyzed? ✓ Can the system assist with generating performance reports? ✓ What data visualization capabilities are needed?</td>
</tr>
<tr>
<td><strong>Security</strong></td>
<td>✓ How does the system meet privacy and security requirements? ✓ How will the system maintain confidentiality across different users?</td>
</tr>
<tr>
<td><strong>Utility</strong></td>
<td>✓ Is the system user-friendly? ✓ Does the system meet the organization/communities needs for managing performance? ✓ How many people need to access system at one time? ✓ What are the training requirements for using the system?</td>
</tr>
</tbody>
</table>

Reporting Protocols

A performance management system is of little value unless it produces helpful information. The analysis, interpretation, and presentation of performance data are necessary to establish accountability and transparency and drive continuous improvement. Consider how and when to share performance data with external and internal stakeholders. Reporting to external stakeholders – including elected officials, funders, interest groups, or the community at large – is important to demonstrate what is being done with taxpayer money and foster trust and public confidence. External stakeholders are generally more interested in outcome measures while shorter-term outcomes and process measures are important for internal use.

In certain instances, public health programs and agencies have mandatory reporting requirements, such as to funders, the board of health, or other governing entities. These reports often include specific metrics related to outputs and budgeting. However, performance data alone does not tell a performance story, so avoid simply presenting stakeholders with a long list of performance metrics. Carefully select which metrics are important to your various stakeholders and present those data with contextual information that helps stakeholders to interpret the data.

When documenting performance reporting protocols and crafting a performance story, consider the following:
- **Responsibilities** – Who is responsible for putting the report together? Who will provide the report to the stakeholder groups?

- **Target Audience** – Are you reporting to internal or external stakeholders? What does each stakeholder group want to know? Which indicators and measures will be reported to each stakeholder group?

- **Reporting Frequency** – How frequently will different levels of performance be reported? In general, process measures should be reported at least quarterly to help staff identify improvements. However, longer-term outcomes may not change as frequently.

- **Reporting Format** – What format will each performance report be presented? Does the target audience prefer verbal presentations, brief reports, or extensive data?

- **Data Presentation** – How will the data be reported? Consider different options for presenting the data such as, displaying trends over time, comparing two defined periods, comparing demographic or customer groups, or benchmarking with state or national performance. Data visualization tools such as line charts, bar graphs, or GIS maps should be used to present the data in an easy to digest format.

- **Context** – The data should be supplemented with qualitative content. What is the environment in which the agency or program is operating? Are certain economic or demographic shifts impacting performance? Did a certain event such as a natural disaster affect operations? Highlight internal and external factors of relevance to explain the results.

- **Customer and Staff Feedback** – Customer groups should be included in the stakeholders for whom performance is reported, however, customers can also provide important context information on results to supplement data with qualitative feedback on performance results. In addition, staff the work directly on the reported programs should also be consulting to understand the results and inform the context.

Use [Worksheet 5](#) to plan reporting protocols and use performance data to craft a core message for different stakeholders.
Step 7: Manage and Improve Performance

**Goal:** Use performance data to continuously improve

By the end of this step, each program or work unit will:

- Identify how performance data will be used to manage performance
- Develop employee feedback mechanisms
- Develop processes for prioritizing and selecting improvement efforts

At this stage, programs have defined key performance goals and objectives that are aligned with the strategic plan and CHIP, identified performance measures and indicators to assess whether objectives are being met, and defined protocols for collecting and reporting data. It is now time to use the data. Using performance data to make management decisions, to provide regular feedback to employees, and to identify and pursue improvement opportunities are all goals of performance management. Described below are common uses of performance data and information.

**Making Decisions around Resource Allocation**

Performance data can help internal managers along with external officials, including funders or elected officials, make decisions around what programs and activities are likely to produce the best outcomes. Tracking outcomes can demonstrate that dollars are being used effectively. Positive program outcomes will help justify sustained funding. Conversely, where program outcomes are worse than expected, performance data (e.g. process and output measures) can help identify causes of the poor outcomes and provide justification for allocating resources to address those issues. With the reality of reduced budgets across health departments, performance data can also be valuable in prioritizing allocation of funding to programs and services.

**Informing Other Agency Planning Efforts**

Performance improvement initiatives are cyclical processes that embody continuous improvement. Just as the CHIP and agency strategic plan inform the performance management process, performance data should continuously feed back into those same planning processes to identify where goals and targets are on track. For new planning cycles, historical performance data can inform future strategy and provide baseline values for relevant goals and objectives.
Establishing Performance Feedback Mechanisms

Providing regular performance feedback to staff after each reporting period will clarify expectations and empower staff to use data in their work, identify improvement opportunities at the team or individual level, and take corrective action to address performance gaps where feasible. Staff often find customer data related to service quality particularly motivating as these are generally more personally rewarding and linked to overall purpose and mission. Incorporating performance targets for unmet goals and objectives into performance reviews is an effective way to align strategy all the way down to the individual level. To create a culture of learning and continuous improvement, frequent and informal “Reflection” sessions can be held with teams to review performance data and brainstorm improvements. Figure 9 provides suggested facilitation questions for leading these sessions.

Identifying Root Causes of Performance Problems

The combination of process and outcome data is valuable to examine why certain performance benchmarks or outcomes are not realized. In some cases, improvement opportunities may be obvious and readily identifiable. In other cases, where a solution is not apparent, the program may choose to sponsor a formal QI project to conduct a root cause analysis and use data to test improvement interventions.

Prioritizing and Selecting QI Projects

Formal QI methods like Lean or Plan-Do-Study-Act (PDSA) are powerful tools to examine performance issues and bring forth measurable improvement. How to conduct a QI project is outside the scope of this guide, however, a common challenge in public health is identifying projects appropriate for QI. The importance of using performance data in QI project prioritization cannot be overstated, so this guide offers the following guidance for prioritizing and selecting QI projects.

QI projects can be resource intensive, before embarking on a QI project, consider whether QI is the best course of action for a problem. Signs that a QI project is needed include inefficiencies (e.g. slow processing times, redundancies), increasing costs, high error rates, critical unmet targets (e.g. high rates of unimmunized children), high variability in results across reporting periods or, high customer dissatisfaction, to name a few.\(^\text{13}\) There are also some signs that a QI project is not indicated; such as:

- **People versus Process** – QI methods are designed to bring forth improvements in processes within a larger system. They are not designed to address performance issues among staff. W. Edwards Deming famously stated, “every system is perfectly designed to get the results it gets.” If staff underperformance is not the result of the processes, then those issues need to be addressed by management, not a QI project.

- **Standardized Processes** – If a program or activity does not have standardized processes, QI should not be used for addressing performance gaps. QI is designed to analyze and improve existing processes. If the processes...
don’t exist, they should first be created with input from those doing the work and from the direct customers. If standardized processes are not being followed by staff, they should be trained in the processes. Please note that training staff on a process is generally not a good QI project as staff should always be trained in their own work processes.

- **Performance Data** – If performance data does not exist, data should be collected prior to initiating a QI project. Performance data is critical to a formal QI method as baseline data is needed for comparative analysis of the test intervention. If performance data is too costly or infeasible to collect, an alternate should be pursued. Likewise, if existing performance data does not indicate evidence of under-performance, then other performance gaps should be prioritized for QI.

- **Clear Solutions** – There are certain performance issues that do not require a scientific QI process to identify and test solutions. For example, if customer feedback indicates clinic hours are inconvenient, an obvious solution would be to adjust the hours. If a solution is clear, then it should simply be implemented without devoting precious resources to a QI project.

- **Longevity** – If a program or service is underperforming but is temporary or likely to go away, the use of QI is typically not appropriate as the result may be irrelevant once the program is gone.

To foster a culture of quality, staff at all levels should be engaged in continuous improvement. Leadership can facilitate staff engagement in QI by providing staff the opportunity to nominate QI projects, the time to devote to QI, and the authority to improve work. **Worksheet 6** can be used by staff and a QI Committee to nominate and screen QI projects.

After screening potential projects, an agreed upon set of criteria and a formal prioritization process (e.g. Prioritization Matrix, Multi-Voting) is helpful to select the highest priority projects. Common criteria include, but are not limited to:

- **Impact** – Which projects have the greatest potential for impact?
- **Urgency** – What risks are associated with not addressing this problem?
- **Alignment** – Does the project align with the agency strategic plan and/or CHIP?
- **Resistance** – Is the project likely to meet resistance from internal or external stakeholders?
- **Feasible** – Do resources and expertise exist to implement this project?

**NACCHO’s Guide to Prioritization Techniques** offers guidance on prioritization techniques for selecting QI projects.

Visit **NACCHO’s Roadmap to a Culture of Quality** for more information on how to integrate continuous quality improvement into organizational culture.

Glossary of Terms

**Community Health Assessment** – Community health assessment (CHA) is a systematic examination of the health status indicators for a given population that is used to identify key problems and assets in a community. The ultimate goal of a CHA is to develop strategies to address the community’s health needs and identified issues. A variety of tools and processes may be used to conduct a community CHA; the essential ingredients are community engagement and collaborative participation.

**Community Health Improvement Plan** - A community health improvement plan (CHIP) is a long-term, systematic effort to address public health problems on the basis of the results of community health assessment activities and the community health improvement process. This plan is used by health and other governmental education and human service agencies, in collaboration with community partners, to set priorities and coordinate and target resources. A CHIP is critical for developing policies and defining actions to target efforts that promote health.

**Community Health Indicator** – A quantitative expression of population level health status rather than the individual level. Indicators tell you something about overall health in the community for which no single organization should be held accountable. Also referred to as a population indicator.

**Goals** - Long-range outcome statements that are broad enough to guide the organization’s programs, administrative, financial and governance functions.

**Impact** - The organizational, community, or system level changes that result, in part, from program activities. Examples may include improved living conditions, improve community indicators, and/or policy change.

**Key Performance Indicator** – A quantitative expression of success or progress toward a strategic goal. KPIs measure critical aspects of achieving strategy in an organization, quantifying results of a program. In contrast to a community health indicator, KPIs measure only measure critical outcomes related to the direct customers of program.

**Logic Model** - visual depiction of the sequential relationship among your program’s resources, activities, outputs, and outcomes

**Objectives** - Short to intermediate outcome statements that are specifically tied to the goal. Objectives are clear, measurable and communicate how a goal will be achieved. Objectives may be referred to as outcome objectives.

**Outcome** - Specific changes in knowledge, attitudes, behaviors, skills, status, or level of functioning expected to result from specific program activities. Outcomes are expressed as different levels of results a program seeks to achieve.

**Performance Improvement** - the positive change in public health capacity, processes, or outcomes using clear and aligned planning, monitoring, and improvement activities.

**Performance Management** – practice of actively using performance data to improve the public’s health through the strategic use of performance standards and measures, progress reports, and ongoing quality improvement.

**Performance Measure** – A quantitative expression of how much, how well, and at what level programs, services, and products are provided to customers within a given period. In other words, performance measures, quantify activities and processes of a program.

**Performance Measurement** - the use of quantitative metrics and indicators to collect data and track progress against goals and objectives.

**Performance Standard** - A performance standard is a management-approved quantified expression of the performance threshold(s), requirement(s), or expectation(s) that work units aim to achieve.
**Quality Improvement** - Quality improvement in public health is the use of a deliberate and defined improvement process, such as Plan-Do-Check-Act, which is focused on activities that are responsive to community needs and improving population health. It refers to a continuous and ongoing effort to achieve measurable improvements in the efficiency, effectiveness, performance, accountability, outcomes, and other indicators of quality in services or processes which achieve equity and improve the health of the community. (Riley, Moran, Corso, Beitsch, Bialek, and Cofsky. *Defining Quality Improvement in Public Health. Journal of Public Health Management and Practice. January/February 2010*).

**Strategic Plan** - A strategic plan results from a deliberate decision-making process and defines where an organization is going. The plan sets the direction for the organization and, through a common understanding of the mission, vision, goals, and objectives, provides a template for all employees and stakeholders to make decisions that move the organization forward. (Swayne, Duncan, and Ginter. *Strategic Management of Health Care Organizations. Jossey Bass. New Jersey. 2008*).

Worksheet 1: Defining a Purpose Statement

Why do we exist? Brainstorm what purpose the program exists to serve. Think in terms of the ultimate impact the program is seeking to make at a broader societal level. This should be something the project does not have full control over but has a role to play in. What impact do we want to see made at a community or society level?

What do we do? Brainstorm broad strategies the program implements to achieve the ultimate impact it is seeking to make. Be careful not to get so specific that you are stating how you do the work. For example, a school health program indicate education as a broad strategy rather than designing training curriculums.

For whom do we do it? List the target population(s) or customers that directly receive the services offered by the program.

Purpose Statement. Write a purpose statement that includes the ultimate impact the program seeks to achieve, the broad strategies used to achieve that impact, and the direct recipients of the program’s products or services.

Program alignment with agency strategy. Based on the purpose statement, articulate how the program links to the agency level strategic plan. For example, think about how the program aligns with the agency mission or vision and explicitly state how the program contributes or relates to strategic priorities identified in the agency strategic plan. Include specific strategic goals or strategies that your program may directly or indirectly impact.
**Worksheet 2: Identifying and Understanding Customer Needs**

**What are our customers’ needs?**  *With the program’s purpose statement in mind, use the following worksheet to identify all the direct and indirect customers of your program. Add more rows as needed.*

<table>
<thead>
<tr>
<th>Customer Group</th>
<th>What are their current needs?</th>
<th>How can we better meet their needs?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**What barriers or challenges have we encountered in delivering this service or meeting customer needs?**

**Which customer needs are we meeting? Which customer groups are the most satisfied with our program or services?**
Worksheet 3: Logic Model

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Activities</th>
<th>Outputs</th>
<th>Short-term Outcomes</th>
<th>Intermediate Outcomes</th>
<th>Long-term Outcomes</th>
<th>Impact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resources to implement activities and produce outputs</td>
<td>Activities implemented to produce outputs</td>
<td>Products and services delivered</td>
<td>Immediate results achieved following delivery of output</td>
<td>Results expected to lead to the end outcome</td>
<td>Ultimate desired change as a result of program</td>
<td>Ultimate change desired outside of your full control</td>
</tr>
</tbody>
</table>

Assumptions, Factors, and Barriers impacting Product/Service Delivery

Assumptions, Factors, and Barriers impact achievement of outcomes

**Develop your logic model.** Fill in the logic model template to identify our processes and outcomes. Consider assumptions, barriers, and other factors or trends impact this work. Start with the right side of the logic model and identify what we are ultimately seeking to achieve and move your way to the left, ensuring that each subsequent column has a logical link. Short, intermediate, and long-term outcomes should all be within our realm of control. Be thoughtful about what we are reasonably seeking to achieve as a result of this project.
Worksheet 4: Develop Goals and SMART Objectives

**Instructions:** Complete the following worksheet to write broad goals that are linked to your program purpose and overall agency strategy. For each goal, write SMART objectives which are sub-steps or milestones toward achieving goals and strategic priorities.

<table>
<thead>
<tr>
<th>Program Purpose/Mission Statement:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agency Level Strategic Priority:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Goal: What is the broad, long-term outcome we want to achieve?</th>
<th>Goal 1:</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>SMART Objectives</th>
<th>Objective 1.1</th>
<th>Objective 1.2</th>
<th>Objective 1.3</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Specific:</strong> Who? (target population and persons doing the activity) and What? (action/activity)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Measurable:</strong> How will we quantify success?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Achievable:</strong> Is this feasible given current resources and constraints?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Relevant:</strong> Will this work help make progress toward the goal and strategic priority?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Time-bound:</strong> Provides a timeline indicating when the objective will be met.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Objective Statement:** Use the information brainstormed above to draft SMART Objective statements.

<table>
<thead>
<tr>
<th>Objective 1.1:</th>
<th>Objective 1.2:</th>
<th>Objective 1.3:</th>
</tr>
</thead>
</table>

SMART objectives which are sub-steps or milestones toward achieving goals and strategic priorities.
Worksheet 5: Develop Reporting Protocols

**Instructions:** Use the following worksheet to plan reporting protocols and to help craft a story to tell with your performance data based on each of your stakeholders’ interests.

<table>
<thead>
<tr>
<th>Key Stakeholder</th>
<th>Why is this stakeholder interested in your program? How are they impacted?</th>
<th>Which metrics and indicators interest this group the most?</th>
<th>What methods would you use to report performance? (e.g. graphs, visuals, presentations)</th>
<th>Using the performance data, what key points would you include in your performance story?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Metrics/Indicators</td>
<td>Reporting Frequency</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Worksheet 6: QI Project Nomination Form

Instructions: Use the following form to describe the rationale for and nominate a QI project.

**Describe the performance gap you want to improve:**

<table>
<thead>
<tr>
<th>What program or organizational goals and objectives are associated with this performance gap?</th>
<th>What specific process and outcome metrics are used to track performance of these goals and objectives?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>What are the specific processes associated with this performance issue (e.g. new staff onboarding, restaurant inspection process, client follow-ups)?</th>
<th>Who are the direct internal or external customers of this process? (e.g. program staff, restaurant owners, community partners)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Does performance data exist to support the need for this project?**
- o Yes
- o No

**If no, can it be feasibly collected?**

Describe the evidence to support the need to work on this issue. Use performance data when possible.

<table>
<thead>
<tr>
<th>Describe the change you hope to see as a result of this project:</th>
</tr>
</thead>
</table>
Cobb Douglas Public Health (CDPH), located in the Northwest suburbs of Atlanta, GA, is one of 18 district health departments in Georgia. Approximately 380 CDPH staff and leadership work diligently to assess and address public health needs of about 900,000 residents of communities in its jurisdiction. CDPH was the first Georgia Health District to achieve accreditation, in May 2015.

Since 2009, CDPH has utilized the Balanced Scorecard framework (BSC), which allows the department to monitor key performance indicators from four perspectives: customer, internal business processes, employee learning and growth, and financial, seen in the CDPH Strategic Management Framework graphic. The BSC is cascaded throughout the agency. In other words, each CDPH employee has a personal scorecard that aligns with the scorecard of their program or center, which aligns with the CDPH scorecard as a whole.

Given that customer is one of four categories in the BSC framework, CDPH was focused on the customer from the outset. Under the priority area of customer, CDPH identified two objectives: provide high quality services to our customers and promote health and prevent injury and disease to achieve healthy outcomes. We have an agency-level balanced scorecard and 30 program scorecards that “roll-up” to the agency-level scorecard. All programs have those 5 customer measures but are able to add additional measures if desired.

To identify customer needs, we asked the following 3 questions:

- Who are your customers?
- What would happy customers say?
- Describe the from-to gap? (this is describing the current state, or where the program is today, and the desired future state, or what happy customers would say in 5 years.)

A customer survey was implemented in January 2017 for 24 out of 30 programs that provide direct services to customers. For programs utilizing the electronic medical records system, a text message is sent to the client within 24 hours of service. The survey is available on the CDPH website and signage with a QR code is posted throughout the agency. The two questions asked of CDPH customers are:

- Overall Customer Satisfaction Rate: Were you satisfied with your overall quality of services?
- Timeliness of Service Delivery: Was your wait time acceptable?

On a quarterly basis, all programs receive a Qualtrics report with their average quantitative responses to 5 questions, along with any qualitative responses collected. These are shared with program staff and entered into InsightVision, the performance management information system used by CDPH (see screenshot below). Providing patient experience results on a quarterly basis allows CDPH leaders to address patient concerns in a timely manner and identify QI efforts to improve performance. We also recognize CDPH employees who are mentioned by name in positive survey comments.

Strengths that supported CDPH to embark on the development and implementation of a comprehensive PM system include leadership support (including Board of Health), community partners, and a strong sense of organizational direction to support the teams involved through ongoing meetings and accountability of team members. The Boards of Health have provided and approved sufficient funding for activities.
From Theory to Practice: Using PM to Achieve Health Equity  
*Harris County Public Health*

The Harris County Public Health (HCPH) performance management (PM) system grew out of a strategic priority aimed at department-wide evaluation and quality improvement. The HCPH Strategic Plan was also the catalyst for integrating health equity into the PM system to put health equity at the core of HCPH’s programs, policies, services, and interventions. Strategic Directive 1C guides HCPH to “work towards eliminating health inequities by assessing inequities among Harris County populations and preventing additional inequities as an unintended consequence of work by HCPH or community partners.” A Health Equity Coordinator and some members of the Health Equity Advisory Committee sit on the Performance and Quality Improvement (PQI) Council to ensure that a health equity lens is applied when collecting and analyzing data, reporting data to a community, as well as monitoring and evaluating activities.

**HCPH’s Health Equity Framework**

HCPH’s Health Equity Dashboard, housed on the Power BI performance management platform, is an interactive user interface that contains information based on current and targeted standards and measures. The health equity standards were developed by a Health Equity Advisory Committee and informed by HCPH’s strategic plan. An informal health equity/social determinants of health (SDOH) inventory helped inform the creation of the dashboard and Health Equity Framework (pictured here). The standards are reflected in both HCPH’s health equity policy and procedures (e.g. communications, community engagement, program development). Starting in 2018, all HCPH staff are required to receive PQI 101 training, which helps them interact with the dashboard and utilize dashboard reports.

**Successes, Challenges, and Lessons Learned**

It is important to define boundaries at a sub-county level to better assess differences, but it is difficult to access data with greater granularity due to barriers such data due to privacy obstacles. Our advice to other health departments who are incorporating a health equity approach into their PM system development is to start small; our indicators were initially focused on place and easily accessible in U.S. Census data. It is also important to consider vulnerable populations that might be overlooked such as military veterans.

We also suggest that others prepare for the unintended consequences of having a PM system. Data is central to our Health Equity Framework because it informs our course of action. Data, however, can be easily distorted, misused, and is practically meaningless without context. The key component to our data analysis is our collaboration with the communities we serve. Understanding a community’s story, their work, and their social needs helps properly contextualize the data and ascribe true meaning.

HCPH believes that what gets measured, gets done. The PM system, particularly the measures linked to community health outcomes, will help HCPH better meet the public health needs of vulnerable people and places within the county. Not only will the PM system help HCPH plan its programs, policies, and interventions but it will allow us to better assess our effectiveness. Our intention is that HCPH’s actions break the cycle of inequity in Harris County and that HCPH does not create or perpetuate existing health inequities.
From Theory to Practice: Evolving the PM System

Houston Health Department

Houston Health Department (HHD) serves a population of 2.2 million people with over 1,200 employees. In 2011, three significant occurrences happened concurrently: initial accreditation preparation, the development of the Office of Performance Management (OPM), and the Mayor’s emphasis on performance within the city. The accreditation team collaborated with Office of Performance Management (OPM) to conceptualize performance management within the agency and, in 2014, Houston became the first city in the state of Texas with an accredited health department.

The PM Journey

Every program was trained in how to develop performance measures, write SMART objectives, and identify indicators. Each department developed objectives and measures which were aligned with the City of Houston’s performance framework and were reported monthly to the mayor. Performance measures were derived from legal requirements, program and grant requirements, department initiatives, and the strategic plan.

Upon the first strategic planning cycle, HCHD realized there was a lack of an accurate way to measure progress towards strategic objectives. During the current iteration, there is a focus on ensuring data is in place and is accessible, and that the objectives in the strategic plan are measurable and can be tracked and entered into the PM software.

Once objectives and measures were in place, every program used an Excel spreadsheet within SharePoint where the data for the measures could be uploaded. The information from these spreadsheets feeds into the current PM software, Klipfolio, which is a good tool for those that need a dashboard up and running quickly, and for those who are not as technologically savvy. HHD experienced great success implementing the dashboard system as staff regularly submit information and dashboard allows performance information to be easily displayed to the directors and governing body.

Upon gaining some experience with PM, more sophisticated data visualization was needed and HCHD decided to begin a transition to the Power BI software. Although Power BI takes more time and skills to set up, the enhanced functionality – including cloud-based technology, security features, and integration with Microsoft - will allow for a more personalized experience for the agency.

The next step is to conduct the NACCHO Organizational Culture of Quality Self-Assessment Tool to inform the QI plan’s focus for the next 3 years. A big focus would be on the department weaknesses and the QI plan will focus on projects that will address those gaps – PM will show us appropriate objectives.

Engaging Staff

As a health department, PM was packaged and branded jointly with accreditation and quality improvement (QI). Initially, these efforts were met with fear, confusion, and disinterest as staff did not understand the relevance to their work and generally feared that it would cause more work or threaten job stability. The Turning Point assessment was used to gauge the staff base knowledge of PM and QI and based on the findings, in-house trainings on PM and QI were delivered. To make the process fun, QI Star Trek, a two-day Train the Trainer program through Public Health Foundation (PHF) was hosted for staff across divisions. Staff received an intensive PM/QI training, formed teams, and came up with a QI project in which they developed an aim statement, performance indicators, measures, and conducted a QI project over the month after the on-site training ended. Following the training, outcomes were tracked the department observed an increase in staff knowledge, validating efforts around this training strategy.

Advice and Lessons Learned

HHD’s main challenge with PM ensuring that data sources were available for selected performance measures. It is important to make sure you have the data and a way to regularly access and report the data. Programs must also understand what is needed long-term as many grant/funding requirements do not necessarily require the same rigor as HHD was working towards.
Developing a PM system forced programs to contemplate which activities are determining the success of the program and created a shift from tracking things that had no bearing on success to identifying the most important and necessary data. Previously, programs were tracking things that had no bearing on success; this process made staff take a closer look at what they are tracking and why.

For health departments embarking on PM, HHD recommends not rushing through the initial phase. It is a time intensive process to make sure things are done correctly and it can be tempting to complete it very quickly. Investing time at the front end and making sure appropriate data sources are available is critical.
From Theory to Practice: Story from the Field

Humbolt County Health Department

Humboldt County Department of Health & Human Services (HCDHHS) serves a rural population of 135,000 in Northeastern, California. For the agency, the deliberate process of developing a documentable performance management system began with PHAB accreditation, which was officially awarded in 2016. Like many health departments, the Turning Point Performance Management Model displayed here was adopted. The first step was to offer a range of training, first to managers and then followed by staff. One of the hurdles was using standardized language for terms like goal, objective, target, performance measure, outcome measure, action, activity, and tactics.

To assist staff in developing program performance measures, they were asked the very simple questions of “why does your program exist?” and “how do you know if you’re succeeding, or doing a good job?” Early on, performance was tracked on a spreadsheet which was updated and printed in a quarterly report forms. This was challenging because it was difficult to get updates from all of the programs and even though a standard report form was used, there was no consistent interpretation of the language. The PM system evolved from an Excel-based platform to a software platform. HCDHHS was especially interested in several specific criteria:

- Cloud-based
- Both internal-facing and external-facing dashboard capabilities
- Multiple licenses
- A shared platform with community partners
- PHAB accreditation / re-accreditation documentation management

Several platforms met the first three criteria, but only one met all 5. It was a bonus that the one we chose also incorporated the Balanced Scorecard framework. Staff contributed to weighting the criteria and InsightVision was ultimately selected. The process was initiated with 10 licenses and a 5-session training with the contractors via “Go-To Meeting”. Follow-ups were conducted with unit-by-unit working sessions to review potential measures and identify how and where the programs align with the strategic plan, workforce development plan, and/or community health improvement plan.

The goal was to find an elegant way to align plans without needless redundancy and confusing narrative describing how the connections. The Balanced Scorecard method assisted with this and help to derive objectives four different perspectives: community (customer); internal processes (programs, policies, etc.); organizational capacity (including workforce); and financial stewardship. All plans were weaved together through these perspectives, and collective, this is the agency performance management system. The InsightVision software platform supports Balanced Scorecard as perspectives are assigned to each objective and objective can be sorted and arranged by plan, program, division, etc. The software also populates a strategy map, which is useful to demonstrate to the public the work of HCDHHS.

The PM system is also used to share data with our community partners and at least one is moving ahead with developing their own similar system. The overall process and outcome is a uniting force to demonstrate with data how the work of the agency is connected to the larger mission, vision, and priorities. A formalized PM system is like adjusting to a new pair of glasses; things look a little fuzzy at first, but now everything is viewed through these lenses.
From Theory to Practice: Story from the Field

Lake County Health Department and Community Health Center (Illinois)

Lake County Health Department and Community Health Center (LCHD/CHC) houses traditional public health programming, a federally qualified health center (FQHC), and behavioral health services. With approximately 1,000 staff it is the largest provider of human services in the county. LCHD/CHC was accredited in 2016.

Evolving from Performance to Quality

In 2013, LCHD/CHC initiated its first soiree into performance management using a modified Balanced Scorecard approach. This process required all approximately 50 programs to develop performance measures in four areas – Health Determinants and Status, Community and Customer, Employees and Capacity, and Financial and Business Processes. With little training in developing measures, staff found the process too complex, resulting in an abundance of performance measures. In 2016, the agency evolved from a performance management system to a quality management system with an increased focus on customer experience and outcomes. The Quality Improvement Team met with each team to reduce and refine existing performance measures into key performance indicators (KPIs), which focus only on finance, quality, and operations and emphasize areas in which the program has some control in influencing.

Quality Alignment

LCHD/CHC performance and quality are aligned across every level, stemming from the community health improvement plan and drilling down to quality improvement planning. The CHIP forms the basis for all alignment and lays the groundwork for all public health interventions in the community. Strategic plan objectives are derived from the CHIP’s strategic priorities. All KPIs align either directly or indirectly with the strategic plan and are assigned to programs that directly affect that KPI. When KPI’s are below their target for two consecutive months, the manager forms a QI team and implements a QI project using the Plan-Do-Study-Act (PDSA) method to fully understand the potential problem. The presented graphic illustrates each level of alignment.

Staff engagement

The work of all staff contributes to meeting KPI targets. All staff have access to the dashboards and are encouraged to review them and suggest ideas for improvement. Mid-level program managers are directly responsible for entering data, meeting targets and initiating QI for unmet targets. Ensuring commitment is most important for this group as they are held accountable for their KPIs and can serve as quality champions. Senior leaders perform a monthly review of their programs’ KPIs and discuss progress and opportunities for improvement with their direct reports. Incorporating individual staff performance goals tied to KPIs is a current work in progress.
Performance Dashboard

Performance data is collected from several disparate data collection systems (e.g. INEDSS, Intergov, NextGen) and stored in Excel spreadsheets. Excel was initially selected because it allowed for a cost-effective and user-friendly system that could be deployed in a reasonable time-frame. This ensured that managers had data to effectively manage programs but knew at the time that it was a temporary solution. A Director of Health Informatics was recently hired to streamline the process of collecting, storing, and accessing data. The ultimate goal is a more robust, user-friendly system with centralized KPIs and reports, more data visualization features, and interoperability to reduce manual data entry.

Moving Forward

The PM system has evolved over time and will continue to evolve. As with anything new, you learn by trial and error. In refining the PM system, program managers and their teams were engaged to understand what was most important to them, pros and cons of the initial PM system, and their needs for the next iteration. Having a PM system created clear expectations of staff and communicated that it’s ultimately all about outcomes. Through this process, LCHD/CHC has already seen some improvement in outcomes and a more positive staff outlook on QI. While this is not yet universal, it is a welcomed worked in progress.
